#### Dear Librarian,

I would like to recommend that your library subscribe to the **Otolaryngology International**. I believe the major future uses of the journal for your library would provide:

1. useful information for members of my specialty.
2. an excellent research aid.
3. an invaluable student resource.

**I have a personal subscription and understand and appreciate the value an institutional subscription would mean to our staff.**

Should the journal you're reading right now be a part of your University or institution's library? To have a free sample sent to your librarian, simply fill out and mail this today!

### Abstract

Adenoiditis and Adenoid Hypertrophy are the most common health conditions afflicting the Paediatric population. Nasopharyngeal obstruction due to Adenoid Hypertrophy leads to Hyponasality, Mouth breathing, Snoring, and Sleep apnea. It also causes Eustachian Tube Dysfunction leading to increased negative middle ear pressure, which is an important etiological factor in the causation of hearing loss in children. This may result in serious consequences in the form of Speech impairment, Inattention, Poor performance in school, Behavioral problems and Impaired intellectual development. *Materials and Method:* In this study, one hundred children (200 ears) aged between 5 and 14 years who underwent Adenoidectomy were analyzed using Otoscopy, Pure Tone Audiometry and Impedance Audiometry pre-operatively and 6 weeks post-operatively. X-Ray Nasopharynx-Lateral view and Diagnostic Nasal Endoscopy was done to assess the grade of Adenoid Hypertrophy. *Results:* It was found that post-operative hearing threshold and middle ear pressures showed significant improvement following Adenoidectomy. The total percentage of ears with normal Type A impedance curve increased from a pre-operative 53.5% to a post-operative 91%. *Conclusion:* Our study concludes that Adenoidectomy has beneficial effects in children with Otitis Media with Effusion and Eustachian Tube Dysfunction.

**Keywords:** Adenoiditis, Adenoid Hypertrophy; Adenoidectomy; Hyponasality.

---

### Introduction

Adenoiditis and Adenoid Hypertrophy are the most common health conditions afflicting the Paediatric population. Nasopharyngeal obstruction due to Adenoid Hypertrophy leads to Hyponasality, Mouth breathing, Snoring, Sleep apnea, Otitis Media with Effusion and Sinusitis.

Eustachian Tube Dysfunction can occur in Adenoiditis and Adenoid Hypertrophy. The functions of the Eustachian Tube include middle ear ventilation to Equalize the middle ear pressure with atmospheric pressure, Clearance of secretions produced within the middle ear into nasopharynx and Protection of middle ear from nasopharyngeal secretions. Hearing is optimal when pressure within the middle ear is relatively the same as that of the

atmosphere. Adenoid Hypertrophy can obstruct the pharyngeal ostia of the Eustachian Tube by mechanical pressure and produce pressure on the lymphatics causing mucosal swelling. It can also act as a carrier of pathogenic bacteria and viruses leading to increased oedema and Eustachian Tube dysfunction.

The presence of Eustachian Tube Dysfunction leads to increased negative middle ear pressure which is an important aetiological factor in the causation of hearing loss. This may result in serious consequences in the form of Speech impairment, Inattention, Poor performance in school, Behavioral problems and Impaired intellectual development.

This study documented the presence of the Eustachian Tube dysfunction in children with Adenoiditis and Adenoid Hypertrophy and the

beneficial effect of Adenoidectomy on Hearing threshold and Middle ear pressures.

### Materials and Method

Patients attending the Department of Otorhinolaryngology at Rajah Muthiah Medical College with symptomatic Adenoiditis and Adenoid Hypertrophy and undergoing Adenoidectomy between October 2015 to August 2017 were included in this study.

One hundred children, of either sex, in the age group between 5 and 14 years suffering from Adenoiditis and Adenoid Hypertrophy were included in the study. X-Ray Nasopharynx-Lateral view and Diagnostic Nasal Endoscopy was done to confirm presence of Adenoid Hypertrophy, to determine size of adenoids and to assess airway patency. Pure Tone Audiometry and Impedance Audiometry was done in all cases before surgery and 6 weeks after Adenoidectomy to assess the Hearing Threshold and Middle Ear Pressures and thereby Eustachian Tube Dysfunction.

Tympanometry was done in all patients pre-operatively and six weeks post-operatively and the results are noted as

Type A- Normal Compliance

Type B- Otitis Media with Effusion with reduced Compliance

Type C- Negative Middle Ear Pressure with normal Compliance

### Endoscopic Grading of Adenoid Hypertrophy

GRADE	Percentage of Obstruction of Choana
I	< 25 %
II	25 - 50%
III	50 - 75%

Grade	Soft Tissue Shadow in Nasopharynx (%)	Adenoid Hypertrophy
1	0-50	Mild
2	50-75	Moderate
3	75-100	Severe

### Inclusion Criteria

1. Children between the ages of 5- 14 years
2. Children presenting with Adenoiditis and Adenoid Hypertrophy (Minimum three episodes/year)
3. Children presenting with complaints of Nasal

Obstruction not influenced by decongestants, Mouth breathing, Snoring, Difficulty in swallowing and Hypoacusis.

### Exclusion Criteria

Children with Cranio-facial anomalies, Nasal septal deviation and Sinonasal infection

## Discussion

Secretory Otitis Media also known as Otitis Media with Effusion has been identified as a common middle ear condition causing deafness in children. It affects the child's learning ability through recurrent temporary hearing loss, permanent hearing impairment and language disorders. A Child with an episode of Otitis Media with Effusion often experiences a mild to moderate fluctuating hearing loss, thus appreciating only partial or inconsistent auditory cues which may make it difficult for the ear to filter it from background noise. It has been hypothesized that this may affect the input to the knowledge base or to the neural substrate on which language learning is built. It also has been proposed that any difficulties attributable to Otitis Media with Effusion associated hearing loss may become evident when a child reaches school age and faces the challenges of school environment. Academic skills particularly reading and other language based subjects may be affected when there is a high demand for attention to verbally presented information.

In my study following Adenoidectomy, Pure Tone Audiometry revealed that Hearing Threshold between 0 and 25 db increased from a pre-operative 74% to a post-operative 90%. Remarkable improvement in Middle Ear Pressure was also noted in the range of middle ear pressure between -99 to 99

mm H20, which increased from a pre-operative 61.5% to a post-operative 90.5%. The above findings substantiate the beneficial role of Adenoidectomy in improving Eustachian Tube Function and Middle Ear Pressure.

The main clinical problem in children with Adenoiditis and Adenoid Hypertrophy is that in some children the symptoms of Otitis Media with Effusion is occult. Some children may present with only poor expression and poor communication skills which parents may find to be trivial and hence neglected. Clinical examination is also difficult, especially in children with narrow ear canal, it is very difficult to examine the tympanic membrane. Children tend to be fearful of otoscopic examination, causing them to cry which in turn will cause tympanic membrane congestion resulting in a possible mis-diagnosis.

Thus diagnosing a child with Otitis Media with Effusion is a tricky task. Regardless of the difficulty in diagnosis, it is extremely important to subject a child with suspected Adenoiditis and Adenoid Hypertrophy to Otoscopic, Radiographic and Audiometric studies so that a diagnosis of Eustachian Tube Dysfunction and Otitis Media with Effusion is not missed. If a diagnosis of Otitis Media with Effusion is suspected, early diagnosis and prompt treatment will significantly improve the child's learning and cognitive abilities.

## Conclusion

As Helen Keller once notably said, *"The problems of deafness are deeper and more complex, if not more important, than those of blindness. Deafness is a much worse misfortune, for it means the loss of the most vital stimulus- the sound of the voice that brings language, sets thoughts astir, and keeps us in the intellectual company of man."* Middle ear effusion and Eustachian Tube Dysfunction caused by Adenoid Hypertrophy and Adenoiditis will adversely affect hearing and interfere with the Child's Intellectual Development and Academic Performance.

Diagnosis of Otitis Media with Effusion in children is often delayed as they cannot complain of hearing loss. Most of the children with abnormal Tympanograms were regarded to have normal hearing by their parents. This may result in serious consequences in the form of Speech impairment, Inattention, Poor performance in school, Behavioral problems and Impaired intellectual development. Thus screening for hearing impairment should include Tympanometry, as Otitis Media with Effusion is one of the most preventable causes of Conductive Hearing Loss. As supported by the results seen in my study, Adenoidectomy has beneficial and constructive effects in children with Eustachian Tube Dysfunction and Otitis Media with Effusion.

**Received on:** 28.11.2017, **Accepted on:** 12.12.2017

---

### Abstract

An interesting case of cemento ossifying fibroma of maxilla in a 61 years old man presenting with ulcer over the left side of hard palate is discussed. The clinical features, investigations, differential diagnosis and management of cemento ossifying fibroma of maxilla is discussed.

**Keywords:** Cemento Ossifying Fibroma; Maxilla.

---

### Case Summary

A 61 year old man presented to ENT OPD with complaints of pain over the left upper premolar tooth and ulcer in the left side of the hard palate for one month duration. Clinical examination revealed an ulcer over the left side of hard palate measuring about 1 x 0.5 cm with irregular margins (Figure 1). The ulcer was 1 cm away from midline extending up to left upper pre molar. The margin of the ulcer was well defined edges and the floor of the ulcer showed granulation tissue. Rest ENT examination was NAD. Diagnostic nasal endoscopy showed normal study. MRI PNS (Figure 2) showed encapsulated fluid signal intensity area at the left side of hard palate with associated cortical breach of alveolar margin of the left side maxilla in the region between canine and first premolar. The differential diagnosis on MRI was osteomyelitis of hard palate with sub periosteal abscess and malignant mixed tumor of hard palate. Biopsy of the lesion showed low grade dysplasia.

All other hematological and biochemical investigations were within the normal range. Patient was advised surgical excision of the lesion. The patient underwent left upper alveolectomy (partial)(Figure 3) under general anaesthesia. The

specimen was sent for histopathological examination which showed bony trabeculae in irregular shape without osteoblastic rimming surrounded by densely haphazardly arranged fibrous stroma. Areas of psammomatous bodies around bony trabeculae are seen. There was no evidence of nuclear atypia, hyperchromasia or nuclear activity and the histopathological picture was suggestive of cemento ossifying fibroma of maxilla (Figure 4).

**Fig. 1:** Photograph of the lesion left upper alveolus

Fig. 2: MRI PNS(Axial) image of the lesion

Fig. 3: Photograph of the resected specimen

Fig. 4: Histopathological picture Haematoxylin and Eosin stain

## Discussion

Ossifying fibroma forms a spectrum of fibro-osseous lesions of the jaws. They are rare, benign, non odontogenic tumors that are commonly seen in the head and neck region.

Cemento ossifying fibroma of the maxilla is an uncommon tumor. The tumor was first described by Menzel in 1872 [1] and the term ossifying fibroma was first given by Montgomery [2] in 1927. It is considered as benign osseous tumor. Lesions with fibrous and osseous component include fibrous dysplasia (FD), ossifying fibroma (OF), cemento ossifying fibroma (COF) and cementifying fibroma (CF) [3].

According to the WHO classification [4] benign fibro-osseous lesions in the oral and maxillofacial region were divided into two categories osteogenic neoplasms and non neoplastic bone lesions. The differential diagnosis based on clinical and radiological examinations poses diagnostic challenges and only histopathological examination is confirmatory.

Ossifying fibroma is most commonly seen between the third and fourth decades of life. It's more frequent in women than men (4:1). The most common location is the mandible in 70-90% of all cases [5]. Generally it is a slow growing tumor usually asymptomatic however the lesion can become large enough to present with facial deformity. Patients generally present with a history of painless expansion of a tooth bearing portion of the mandible. Lesions of the maxilla are less common.

Histologically these tumours are well vascularised consisting of fibrocellular tissue with capacity to form immature bone trabeculae and cementoid formations. These findings are not specific as it's seen in fibrous dysplasia as well. So a definitive diagnosis requires correlation of clinical, radiological and pathological evaluation [6].

Radiologically Cemento ossifying fibroma has different patterns based on the amount of mineralized tissue. It presents as demarcated unilocular lesion that might have a different degree of opacification. The differential diagnosis based on radiological evaluation included chondrosarcoma, osteosarcoma, fibrous dysplasia, odontogenic cysts, Gorlin's cyst and pindborg tumour. The well defined borders of Cementoossifying fibroma helps to differentiate from sarcoma and carcinoma. Fibrous dysplasia has a typical ground glass appearance.

The underlying cause of this condition is not known, there have been reports of past trauma in the area of lesion, postulating as a connective tissue reaction than a genuine neoplasm [7].

The treatment of ossifying fibroma is surgical with surgical options being enucleation, curettage and radical surgery.

The recommended treatment of choice is excision of tumour including a rim of normal tissue. Management should be individualized based on size, location, benign nature and growth behavior of the lesion. In our case considering malignancy as a differential diagnosis we did a left upper alveolectomy (partial) under general anaesthesia.

### Conclusion

The diagnosis of cemento ossifying fibroma can pose a diagnostic dilemma. The diagnosis should be carefully considered after ruling out malignancy. Imaging and histopathological examination play a crucial role in establishing the diagnosis.

### Abstract

Super vasmol 33 is a Hair dye also known as ParaPhenylenediamine (PPD) is a Common house hold Poison used as a suicidal agent because of its low cost and easy availability in the market. There are Many case reports of Paraphenylenediamine (PPD) poison used for deliberate self harm by adults and Accidental ingestion by children. We report a case of a 20 year old female who intentionally consumed Super vasmol poison, and presented to our casualty within 6 hours of ingestion with Angioedema of face And Severe Respiratory Distress. Timely Tracheostomy after failed intubation proved to be a life saving Procedure in our patient.

**Keywords:** Super Vasmol Poison; Emergency Tracheostomy.

---

### Introduction

Super vasmol also known as Paraphenylenediamine (PPD) is an aromatic amine which is used in variety of industrial products and by hair dye companies. The constituents of this hair dye are PPD, sodium lauryl Sulphate, EDTA, cestostearyl alcohol, resorcinol, propylene glycol, liquid paraffin, herbal extracts, Preservatives [1]. A rising trend of super vasmol poison ingestion both accidental and as a means of Deliberate self harm has been reported in India [2].

Paraphenylenediamine poisoning is reported globally, More so in developing countries. The first artificial dye was synthesized in the laboratory in 1856 [3].

In 1990 the number one leading Cause of poisoning in Morocco was found to be PPD [4] which caused Contact dermatitis in susceptible individuals, but its ingestion lead to Acute Angioedema of face and neck, Rhabdomyolysis and Acute Renal Failure [5,7].

### Case Report

A 20 year old female was brought by her parents to casualty with complaints of Swelling over the face and inability to speak for 3 hours duration. On general examination patient was conscious but Unable to speak because of edema of the face and neck. Pulse 84/min regular, BP 110/70mmHg, RR16/min, SpO<sub>2</sub> 92% on room air. Examination of oral cavity showed limited mouth opening and Edema of tongue. Neck examination revealed cervico facial swelling. Detailed history revealed that the Patient had orally consumed super vasmol hair dye as an act of suicide 7 hours prior to Reporting to casualty. 30 minutes after admission in the casualty the patient developed Severe Stridor And started to desaturate, SpO<sub>2</sub> dropped to less than 60%, patient was immediately shifted to emergency Operating room where oral intubation could not be attempted in view of the cervico facial and oral edema. Blind nasal intubation was tried which resulted in failure to intubate, flexible video laryngoscopy guided intubation was also attempted which showed edema

**Fig. 1:** Patient at the time of presentation to casualty, failure of flexible video laryngoscopy, intra operative tracheostomy and immediate post operative period

**Fig. 2:** Post operative follow up and ENT OPD review for video direct laryngoscopy

**Fig. 3:** Patient after post tracheostomy stoma closure

of epiglottis, false cords and true vocal cords, and the attempted intubation resulted in failure. Immediately a life saving Emergency tracheostomy was performed on this patient, portex tracheostomy tube 7 size was used to secure the airway and with ventilatory support the patient was shifted to intensive care unit. Initial blood parameters showed Hb -12.3gm%, wbc 9,600 cells/cumm, platlet-2.3lakh, serum urea-28mg/dl, serum creatinine 0.6mg/dl. Sodium 139, potassium 4.1 chloride 99 mmol/L. 18 hrs after admission the patients urine examination revealed proteinuria, haemoglobinuria and hemosiderinuria. CREATININE KINASE was 440 U/L. Liver function test was WNL. Patient was given symptomatic treatment and adequate i.v hydration, intake and output was monitored. On the 5 th day of admission, patient's blood and urine examination was WNL, facial edema reduced significantly, patient was discharged after 10 days with fullers metal tracheostomy tube insitu, and follow up in Psychiatry and ENT department.

### Discussion

Suicidal tendencies and suicidal rates have drastically increased over the past few decades and the common available super vasmol hair dye has become one of the important house hold substance used as a means of poisoning [1]. In 1924 Nott documented the first case of PPD poison in the owner of a hair saloon [6]. Paraphenylenediamine (PPD) is

a derivative of paranitroaniline which on oxidation produces Bondrowski's base which is highly toxic, mutagenic and an allergen [7]. PPD is used along with ammonia and hydrogen peroxide in hair dyeing and also when added to henna it is used in tattooing for its darkening effects [9]. Onset of symptoms after ingestion of super vasol poison is usually between 4 -6 hours. The symptoms are considered to be dose related and patients after ingestion of large quantity (7-10 gm of super vasol) have higher morbidity and mortality [7]. Patient presents most commonly with Angioedema of face and neck, and Respiratory Distress. Organ damage caused by super vasol poison may be assessed by appropriate tests in case with rhabdomyolysis, kidney and liver involvement. The effect of resorcinol is associated with seizure, coma, methaemoglobinemia, acute tubular necrosis, arrhythmias, intra vascular haemolysis, gastritis, vertigo, tremors, myocarditis and arrhythmias. The characteristic triad mentioned in literature is ANGIO NEUROTIC OEDEMA of face and neck leading to stridor, RHABDOMYOLYSIS with chocolate coloured urine and ACUTE RENAL FAILURE could be a confirmative evidence of Paraphenyldiamine poison even in the absence of laboratory facilities and when history is lacking in case of emergency [9]. Cervico Facial Oedema was the most marked presentation in our patient, severe enough to cause Respiratory Distress. Timely management to secure the airway was under taken and emergency tracheostomy was performed as a life saving procedure for the patient, Anti histamine and steroids were used to treat the patient although there is no therapeutic trials as to their benefit. Forced diuresis and maintenance of high urine output was done to augment the patient's renal function which improved in the following days. There is no specific antidote for PPD poison [2]. Treatment is mainly symptomatic and supportive. Early clinical diagnosis and timely intervention in securing an open airway, maintenance of adequate hydration and oxygenation along with good urine output is the corner stone of successful management and outcome.

## Conclusion

Super vasol poison is rapidly emerging as a suicidal poison because of its easy availability and

Extensive use, hence awareness of its effects and side effects is important. The classical presentation of Cervico Facial Angioedema, severe Rhabdomyolysis and Acute Renal Failure warrants early diagnosis

And intervention to secure the airway and aggressive supportive is required to prevent organ failure.

Legislation is required to ensure that the hair dye is not freely available in the market.

### Abstract

Malignant fibrous histiocytoma (MFH) is a high grade and aggressive sarcoma accounting for around 20% of soft tissue sarcomas. These tumors rarely arise in the head and neck. A case of malignant fibrous histiocytoma of the right upper alveolus in a lady is described. The clinical features, investigative modalities, diagnostic features and management is described.

**Keywords:** Histiocytoma; Sarcoma; Alveolus; Fibrous; Recurrence.

---

### Introduction

Malignant fibrous histiocytoma (MFH) is a high grade sarcoma originally described by O'Brien and Stout in 1964 [1]. It is the most common soft tissue sarcoma occurring in late adult life between 50 - 70 years and is extremely rare in childhood. MFH occurs most commonly in the extremities (70 - 75%) with lower extremities accounting for 59% of cases followed by the retroperitoneum [1]. Tumors typically arise in deep fascia or skeletal muscle and rarely arise in the head and neck.

### Case Report

62 yr old lady presented with history of growth right upper alveolus for 6months with comorbid conditions of diabetes and hypertension. She was a known tobacco chewer for the last 20 years. On examination she had an proliferative 4\*3 cm growth right upper alveolus extending from right lateral incisor and posteriorly till right 2<sup>nd</sup> upper molar involving right gingivo buccal sulcus and right hard palate (Figure 1). Neck Right level II and III nodes

1\*1 cm were palpable. Biopsy was suggestive of a poorly differentiated malignant mesenchymal neoplasm.

CECT scan (Figure 2) showed enhancing soft tissue density noted involving the right alveolus of the maxilla measuring about 3x 1.2 cm with minimal bony erosion. Multiple enlarged cervical lymphadenopathy involving Ib, II, III, was seen on the right side. PETCT showed metabolically active disease right upper alveolus (SUV max 10.63) with enlarged cervical nodes were seen at level IB,II,III right side with the largest right level II (33\*30 mm, SUV max 13.17). There were no distant metastasis.

Disease was initially staged as Malignant mesenchymal neoplasm Right upper alveolus T4 N2bM0. Patient underwent Right Infrastructural maxillectomy (Figure 3) with Right Modified Neck Dissection Type III with reconstruction by Anterolateral thigh flap (Figure 4). Histopathology on gross showed proliferative tumor hard palate 2.4\*2.3\*2 cm. All cut margins were free, 10/19 nodes were positive.

Microscopic examination (Figure 5) showed highly pleomorphic spindle to polygonal cells with marked variation in size shape, marked nuclear

atypia with enlarged hyperchromatin nucleus, irregular nuclear membrane, prominent nucleoli and moderate amount of eosinophilic cytoplasm. 2-3 mitosis/10 high power field. These cells were arranged in bundles, fascicles arranged in herring bone pattern and arranged in variable direction in fibromyxoid stroma. Increased angiogenesis was seen. On IHC vimentin was strongly positive. Rest markers cK, Cd31, Cd34, LCA, EMA, HMB, Desmin all were negative. On followup of 3 years patient is asymptomatic with no recurrence.

**Fig. 1:** Showing the tumor involving the Right hard palate and right upper alveolus

**Fig. 2:** CECT scan showing the tumor involving the right upper alveolus

**Fig. 3:** Showing Right infrastructural maxillectomy specimen

**Fig. 4:** Showing reconstruction of maxillary defect by anterolateral thigh flap

**Fig. 5:** Photomicrograph high power showing storiform pattern of MFH

## Discussion

Malignant fibrous histiocytoma tumors (MFH) rarely occur in the head and neck with an incidence of 1-2% [2]. In this region, prevalence of the tumor in the nasal cavity and paranasal sinuses is 30%, craniofacial bones is 15-25%, larynx and soft-tissue of neck is 10-15% each, and oral cavity 5-15% [3]. In our case, it has affected the maxillary alveolar ridge and the hard palate.

Male predominance has been reported for this neoplasm with a male: female ratio of 2:1. However Chen et al [3] found a female predominance with male: female ratio of 1:2. In our case, it was a primary tumor reported in a lady.

MFH tumors can be either primary or secondary. Primary tumors are less aggressive and more

common than secondary tumors [4]. Secondary tumors are generally associated with underlying conditions such as prior radiotherapy prior trauma, fibrous dysplasia or benign bone tumors like enchondroma. MFH may occur at any age, with a peak incidence in the fifth to seventh decade. MFH is one of the most common Radiation-induced sarcoma of the head and neck. The period of latency between initial radiation therapy and diagnosis of Radiation-induced sarcoma ranged from 9 - 45 years with a median of 17 years [5].

The exact histogenesis of MFH remains controversial. The majority of investigators have suggested that histiocytic and fibrocytic cell lines are derived from the small numbers of undifferentiated mesenchymal cells [6]. In general, the tumor contains both fibroblast like and histiocyte like cells in varying proportions, with spindled and rounded cells exhibiting a storiform arrangement.

Enzinger and Weiss have defined five histological subtypes of MFH as follows: storiform-pleomorphic, myxoid, giant cell, inflammatory, and angiomatoid. The storiform-pleomorphic and myxoid variants are the most common type. MFH is generally seen between the ages of 50 and 70 years. An exception is the angiomatoid variant that usually affects individuals who are younger than 20 years old [1-3]. Tumors with angiomatoid and myxoid patterns are often associated with a more favorable prognosis as they metastasise late and respond well to surgery [2]. The inflammatory and, the pleomorphic types are more aggressive, metastasise early and respond less favorably to surgery alone [7]. Our patient showed malignant tumor arranged predominantly in form of in storiform pattern.

In recent times MFH is considered as a form of fibrosarcoma and the tumor is very likely over diagnosed by some pathologists. This is because the more pleomorphic the tumor, the more difficult is to distinguish from other types of sarcomas, such as spindle cell carcinoma, pleomorphic leiomyosarcoma and pleomorphic liposarcoma. Distinction among these soft tissue tumors is best achieved by a joint immunohistochemical and ultrastructural study.

Fibrous histiocytoma is typically immunoreactive for vimentin, and sometimes for smooth muscle actin or alpha-1antitrypsin, but not for desmin, keratin, epithelial membrane antigen, S-100 protein, factor VIII-related antigen, CD34, or carcino-embryonic antigen, supporting the hypothesis that the tumor cells are of mesenchymal origin.

Surgery is the best treatment for this aggressive neoplasm. The advent of more advanced

reconstructive techniques including free tissue transfer has made more aggressive surgical resection of these tumors possible. Local recurrence rate of MFH after initial local excision ranges between 16% and 52%. Block et al [7] reported local recurrence or distant metastasis in 55% of cases of MFH. Recurrence is related to size, depth of invasion, and microscopically positive surgical margins. The presence of positive surgical margins after definitive treatment is the single most important factor relating to local recurrence [8].

Owing to the high incidence of local recurrence, postoperative radiotherapy is generally advocated. Incidence of distant metastases is 25-35% in patients with MFH of head and neck region with pulmonary being most common (90%) followed by bone (8%), and liver [3]. The 5-year survival rate ranges from 35-60%. The primary tumor factors associated with a worse prognosis are the histologic subtype, necrosis, a high mitotic count, and blood vessel invasion [9]. The clinical stage of the tumor, which is defined by tumor grade, size, and presence of distant metastases, is the most important prognostic factor. Other clinical predictors of a poor outcome include advanced age, male gender, underlying systemic illness, large primary tumors, tumors arising from the bones, deep-seated tumors, and a history of previous radiation [2,10].

## Conclusion

Malignant fibrous histiocytoma of the head and neck is an aggressive tumor. Inadequate resection is related to a higher local recurrence rate and worse prognosis and hence these tumors need to be resected as extensively as possible.

### Abstract

Pyogenic granuloma is an inflammation induced hyperplastic lesion involving oral cavity in response to various stimuli such as low grade local irritation, traumatic injury or hormonal factors. We report a case of 8 years old female patient with a midline lesion on the dorsum of tongue which was successfully excised under local anaesthesia and the histopathological study revealed it as pyogenic granuloma.

**Keywords:** Pyogenic Granuloma; Tongue; Midline.

---

### Introduction

Hullihen [1-8] reported the first case of Pyogenic granuloma in 1844. But Hartzell in 1904 [1,8] coined the current term, pyogenic granuloma or granuloma pyogenicum. Pyogenic granuloma is a common lesion occurring on the skin [8] and extremely rare in the oral cavity where it is present over the keratinized tissue [1]. The name pyogenic granuloma is a misnomer since the condition is not associated with pus and does not represent a granuloma histologically [1,4,5]. The role of infective agents may play a part in recurrent Pyogenic granuloma. There are two types of Pyogenic granuloma, Lobular Capillary haemangioma (LCH) type and non-Lobular Capillary Haemangioma (non-LCH) type [1,8].

The pyogenic granuloma is a non-neoplastic [2,5] soft tissue tumour of oral cavity that is believed to be reactive to stimuli such as local irritation [2], traumatic injury, hormonal factors, and involves the gingiva most commonly [1,2]; rarely it can occur on lips, tongue, buccal mucosa and palate [3]. There is a high degree of occurrence in second [4], third, fourth

decade [6], with male to female ratio of 1:1.7 [6,10]. Characteristically, pyogenic granuloma of tongue is more common on the lateral side of the tongue which may be related to trauma from adjacent sharp teeth or ill-fitting dentures [4,9].

The purpose of this article is to report an unusual case of pyogenic granuloma with the lesion occurring in the midline on the dorsum of the tongue.

### Case Report

A 8 years old female child reported to Department of Otorhinolaryngology OP, Rajah Muthiah Medical college Hospital, with complaints of swelling over the dorsum of the tongue for the past two months with complaints of discomfort while eating and history of bleed from the lesion sometimes. Clinically, intra oral examination revealed, a 1.0 x 0.8 x 0.5 cms pedunculated growth, red in colour which was present in the midline on the dorsum of the tongue (Figure 1 a). It was firm in consistency, non-tender, bled on touch. Routine laboratory investigations were normal. The lesion was excised

completely including a cuff of normal tissue (Figure 1b) under local anaesthesia and biopsy specimen was sent for histopathological examination. The raw area was closed with chromic catgut (Figure 1c)

#### *Histopathological Examination*

HPE study shows tissue lined by stratified

squamous epithelium showing mild hyperkeratosis, marked acanthosis and ulceration.

The underlying tissue shows a tumor mass comprising of numerous small capillary spaces lined by benign vascular endothelial cells, surrounded by fibrous stroma. Stroma is infiltrated with acute and chronic inflammatory cells (Figure 1d).

**A**

**B**

**C**

**D**

**Fig. 1:** (a) Shows red pedunculated lesion on the midline of the dorsum of tongue, (b) after removal of the lesion, (c) Sutured with catgut (d) Histopathological study section.

#### **Discussion**

Pyogenic granuloma is more commonly seen on the gingiva [1,10], particularly in the anterior segment [7], and uncommonly seen elsewhere in the

mouth, such as the upper and lower lip, buccal mucosa, tongue, and the alveolar mucosa, particularly in edentulous regions [7]. The causative factors may be exaggerated localized tissue reaction to a trauma or any irritation like calculus, poor oral hygiene [8], nonspecific infection, overhanging

restorations, cheek biting, previous dental extractions, exfoliating primary teeth, bone spicules, root remnants, tooth brush trauma [5]. Characteristically, lateral side of tongue will be affected and may be related to trauma from adjacent structures [9]. In our case the lesion was found to arise unusually from one of the rare extra gingival site, on the midline on the dorsum of the tongue.

The pathogenesis of pyogenic granuloma can be attributed to an imbalance between inducers and inhibitors of angiogenesis. Excessive formation of Vascular Endothelial Growth Factor (VEGF), basic Fibroblast Growth Factor (bFGF) and lowering of angiostatin, thrombospondin-1 and Estrogen receptors leads to the formation of Pyogenic Granuloma [4].

Clinically these lesions usually present as a single red to purple nodule or sessile papule with smooth or lobulated surface depending upon the duration and vascularity of the lesion [5]. Younger lesions are usually red because they are highly vascular and are mainly composed of hyperplastic granulation tissue in which capillaries are prominent and older lesions are pink because they tend to become more collagenized [1,4]. Studies show that there are two types of Pyogenic granuloma clinically, LCH type occurring as sessile mass and histologically it is characterised by proliferating blood vessels that are organised in lobular aggregates though the lesion does not undergo specific change such as edema, capillary dilation or inflammatory granulation tissue reaction. The lobular area of LCH type Pyogenic Granuloma, has a greater number of blood vessels with small luminal diameter [1,8]. The non-LCH type Pyogenic Granuloma occurs as a pedunculated mass and histologically it consists of highly vascular proliferation that resembles granulation tissue and the central area contains a significantly greater number of vessels with perivascular mesenchymal cells non-reactive for alpha-smooth muscle actin and muscle specific actin [8]. The non-LCH type Pyogenic Granuloma is more frequently associated with etiological factors [1] like local irritation, trauma, hormonal imbalance.

Pyogenic granuloma varies in size from millimetres to centimetres but usually they are less than 2.5cms in size [1,5]. The lesion usually starts as small swelling and reaches its maximum size within weeks and remains stationary. It presents as a slow growing, asymptomatic and painless tumor [10]. It can be painful and may bleed if the lesion is present in areas where it is subjected to repeated irritation.

The diagnosis can be made Clinically and confirmed by Histopathology [7]. Radiographs are

suggested to rule out bony involvement, malignancy and to identify any foreignbody as an etiological factor [2,5].

When a mass lesion is found in the oral cavity, it is important to formulate a differential diagnosis, including Traumatic fibroma, peripheral giant cell granuloma, peripheral ossifying fibroma, odontogenic fibroma, post extraction granuloma, metastatic cancer, kaposi sarcoma, non hodgkins lymphoma, haemangioma, basillary angiomatosis, angiosarcoma [4,5]. All excised Pyogenic granulomas should be sent for histopathological examination to rule out malignant changes and for the treatment and prognosis.

Management is based on the severity of symptoms [1]. If lesion is small, and there is no pain or bleeding, the removal of irritants and follow up can be advised. If the lesion is large, painful and bleeds, then complete surgical excision is the treatment of choice [3,5].

Other modalities have been proposed. Cryosurgery is the safe, easy and inexpensive procedure [6]. Nd:YAG laser excision is preferred than CO<sub>2</sub> laser because of its superior coagulation characteristics. In some studies, Flash lamp pulsed dye laser was used in masses which are concluded as resolute tissue, responded well to series of treatment. Ultrasonic scissors [4] is a newly developed technique and is also used in Pyogenic granuloma excision with the advantages of less blood loss and operative time. Sodium tetradecyl sulfate sclerotherapy is better alternative for excision as the technique is simple, produces less scarring even though multiple sessions are required. Series of Intra lesional corticosteroid injection, absolute ethanol [4] are used if there is any recurrence. Recurrence is believed to be due to incomplete excision, failure to remove irritants, re injury, poor oral hygiene.

## Conclusion

Although the occurrence of non-LCH type Pyogenic Granuloma in the Dorsum of the tongue is rare, poor oral hygiene could be a causative factor. Prevention, prompt diagnosis, management and treatment are important. Pyogenic granuloma occurs as a result of various stimuli such as low grade irritation, trauma, poor oral hygiene, hormonal factors, certain drugs, thus removal of cause is an important step in treatment. Although the diagnosis is made clinically, histopathological confirmation is mandatory for the final diagnosis and effective management.

Manuscripts must be prepared in accordance with “Uniform requirements for Manuscripts submitted to Biomedical Journal” developed by international committee of medical Journal Editors.

## Types of Manuscripts and Limits

Original articles: Up to 3000 words excluding references and abstract and up to 10 references.

Review articles: Up to 2500 words excluding references and abstract and up to 10 references.

Case reports: Up to 1000 words excluding references and abstract and up to 10 references.

## Online Submission of the Manuscripts

Articles can also be submitted online from [http://rfppl.co.in/customer\\_index.php](http://rfppl.co.in/customer_index.php).

1) First Page File: Prepare the title page, covering letter, acknowledgement, etc. using a word processor program. All information which can reveal your identity should be here. use text/rtf/doc/PDF files. Do not zip the files.

2) Article file: The main text of the article, beginning from Abstract till References (including tables) should be in this file. Do not include any information (such as acknowledgement, your name in page headers, etc.) in this file. Use text/rtf/doc/PDF files. Do not zip the files. Limit the file size to 400 Kb. Do not incorporate images in the file. If file size is large, graphs can be submitted as images separately without incorporating them in the article file to reduce the size of the file.

3) Images: Submit good quality color images. Each image should be less than 100 Kb in size. Size of the image can be reduced by decreasing the actual height and width of the images (keep up to 400 pixels or 3 inches). All image formats (jpeg, tiff, gif, bmp, png, eps etc.) are acceptable; jpeg is most suitable.

Legends: Legends for the figures/images should be included at the end of the article file.

If the manuscript is submitted online, the contributors’ form and copyright transfer form has to be submitted in original with the signatures of all the contributors within two weeks from submission. Hard copies of the images (3 sets), for articles submitted online, should be sent to the journal office at the time of submission of a revised manuscript. Editorial office: Red Flower Publication Pvt. Ltd., 48/41-42, DSIDC, Pocket-II, Mayur Vihar Phase-I, Delhi – 110 091, India, Phone: 91-11-22754205, 45796900, 22756995. E-mail:

[author@rfppl.co.in](mailto:author@rfppl.co.in). Submission page: [http://rfppl.co.in/article\\_submission\\_system.php?mid=5](http://rfppl.co.in/article_submission_system.php?mid=5).

## Preparation of the Manuscript

The text of observational and experimental articles should be divided into sections with the headings: Introduction, Methods, Results, Discussion, References, Tables, Figures, Figure legends, and Acknowledgment. Do not make subheadings in these sections.

## Title Page

The title page should carry

- 1) Type of manuscript (e.g. Original article, Review article, Case Report)
- 2) The title of the article, should be concise and informative;
- 3) Running title or short title not more than 50 characters;
- 4) The name by which each contributor is known (Last name, First name and initials of middle name), with his or her highest academic degree(s) and institutional affiliation;
- 5) The name of the department(s) and institution(s) to which the work should be attributed;
- 6) The name, address, phone numbers, facsimile numbers and e-mail address of the contributor responsible for correspondence about the manuscript; should be mentioned.
- 7) The total number of pages, total number of photographs and word counts separately for abstract and for the text (excluding the references and abstract);
- 8) Source(s) of support in the form of grants, equipment, drugs, or all of these;
- 9) Acknowledgement, if any; and
- 10) If the manuscript was presented as part at a meeting, the organization, place, and exact date on which it was read.

## Abstract Page

The second page should carry the full title of the manuscript and an abstract (of no more than 150 words for case reports, brief reports and 250 words for original articles). The abstract should be structured and state the Context (Background), Aims, Settings and Design, Methods and Materials, Statistical analysis used, Results and Conclusions. Below the abstract should provide 3 to 10 keywords.

## Introduction

State the background of the study and purpose of the study and summarize the rationale for the study or observation.

## Methods

The methods section should include only information that was available at the time the plan or protocol for the study was written such as study approach, design, type of sample, sample size, sampling technique, setting of the study, description of data collection tools and methods; all information obtained during the conduct of the study belongs in the Results section.

Reports of randomized clinical trials should be based on the CONSORT Statement (<http://www.consort-statement.org>). When reporting experiments on human subjects, indicate whether the procedures followed were in accordance with the ethical standards of the responsible committee on human experimentation (institutional or regional) and with the Helsinki Declaration of 1975, as revised in 2000 (available at [http://www.wma.net/e/policy/17-c\\_e.html](http://www.wma.net/e/policy/17-c_e.html)).

## Results

Present your results in logical sequence in the text, tables, and illustrations, giving the main or most important findings first. Do not repeat in the text all the data in the tables or illustrations; emphasize or summarize only important observations. Extra or supplementary materials and technical details can be placed in an appendix where it will be accessible but will not interrupt the flow of the text; alternatively, it can be published only in the electronic version of the journal.

## Discussion

Include summary of key findings (primary outcome measures, secondary outcome measures, results as they relate to a prior hypothesis); Strengths and limitations of the study (study question, study design, data collection, analysis and interpretation); Interpretation and implications in the context of the totality of evidence (is there a systematic review to refer to, if not, could one be reasonably done here and now?, What this study adds to the available evidence, effects on patient care and health policy, possible mechanisms)? Controversies raised by this study; and Future research directions (for this particular research collaboration, underlying

mechanisms, clinical research). Do not repeat in detail data or other material given in the Introduction or the Results section.

## References

List references in alphabetical order. Each listed reference should be cited in text (not in alphabetic order), and each text citation should be listed in the References section. Identify references in text, tables, and legends by Arabic numerals in square bracket (e.g. [10]). Please refer to ICMJE Guidelines ([http://www.nlm.nih.gov/bsd/uniform\\_requirements.html](http://www.nlm.nih.gov/bsd/uniform_requirements.html)) for more examples.

### Standard journal article

[1] Flink H, Tegelberg Å, Thörn M, Lagerlöf F. Effect of oral iron supplementation on unstimulated salivary flow rate: A randomized, double-blind, placebo-controlled trial. *J Oral Pathol Med* 2006; 35: 540-7.

[2] Twetman S, Axelsson S, Dahlgren H, Holm AK, Källestål C, Lagerlöf F, et al. Caries-preventive effect of fluoride toothpaste: A systematic review. *Acta Odontol Scand* 2003; 61: 347-55.

### Article in supplement or special issue

[3] Fleischer W, Reimer K. Povidone iodine antiseptics. State of the art. *Dermatology* 1997; 195 Suppl 2: 3-9.

### Corporate (collective) author

[4] American Academy of Periodontology. Sonic and ultrasonic scalers in periodontics. *J Periodontol* 2000; 71: 1792-801.

### Unpublished article

[5] Garoushi S, Lassila LV, Tezvergil A, Vallittu PK. Static and fatigue compression test for particulate filler composite resin with fiber-reinforced composite substructure. *Dent Mater* 2006.

### Personal author(s)

[6] Hosmer D, Lemeshow S. Applied logistic regression, 2<sup>nd</sup> edn. New York: Wiley-Interscience; 2000.

### Chapter in book

[7] Nauntofte B, Tenovou J, Lagerlöf F. Secretion and composition of saliva. In: Fejerskov O, Kidd EAM,

editors. Dental caries: The disease and its clinical management. Oxford: Blackwell Munksgaard; 2003. p. 7-27.

### **No author given**

[8] World Health Organization. Oral health surveys - basic methods, 4<sup>th</sup> edn. Geneva: World Health Organization; 1997.

### **Reference from electronic media**

[9] National Statistics Online – Trends in suicide by method in England and Wales, 1979-2001. [www.statistics.gov.uk/downloads/theme\\_health/HSQ\\_20.pdf](http://www.statistics.gov.uk/downloads/theme_health/HSQ_20.pdf) (accessed Jan 24, 2005): 7-18. Only verified references against the original documents should be cited. Authors are responsible for the accuracy and completeness of their references and for correct text citation. The number of reference should be kept limited to 20 in case of major communications and 10 for short communications.

More information about other reference types is available at [www.nlm.nih.gov/bsd/uniform\\_requirements.html](http://www.nlm.nih.gov/bsd/uniform_requirements.html), but observes some minor deviations (no full stop after journal title, no issue or date after volume, etc).

### **Tables**

Tables should be self-explanatory and should not duplicate textual material.

Tables with more than 10 columns and 25 rows are not acceptable.

Table numbers should be in Arabic numerals, consecutively in the order of their first citation in the text and supply a brief title for each.

Explain in footnotes all non-standard abbreviations that are used in each table.

For footnotes use the following symbols, in this sequence: \*, †, ‡, §§,

### **Illustrations (Figures)**

Graphics files are welcome if supplied as Tiff, EPS, or PowerPoint files of minimum 1200x1600 pixel size. The minimum line weight for line art is 0.5 point for optimal printing.

When possible, please place symbol legends below the figure instead of to the side.

Original color figures can be printed in color at the editor's and publisher's discretion provided the author agrees to pay.

Type or print out legends (maximum 40 words, excluding the credit line) for illustrations using double spacing, with Arabic numerals corresponding to the illustrations.

### **Sending a revised manuscript**

While submitting a revised manuscript, contributors are requested to include, along with single copy of the final revised manuscript, a photocopy of the revised manuscript with the changes underlined in red and copy of the comments with the point to point clarification to each comment. The manuscript number should be written on each of these documents. If the manuscript is submitted online, the contributors' form and copyright transfer form has to be submitted in original with the signatures of all the contributors within two weeks of submission. Hard copies of images should be sent to the office of the journal. There is no need to send printed manuscript for articles submitted online.

### **Reprints**

Journal provides no free printed reprints, however a author copy is sent to the main author and additional copies are available on payment (ask to the journal office).

### **Copyrights**

The whole of the literary matter in the journal is copyright and cannot be reproduced without the written permission.

### **Declaration**

A declaration should be submitted stating that the manuscript represents valid work and that neither this manuscript nor one with substantially similar content under the present authorship has been published or is being considered for publication elsewhere and the authorship of this article will not be contested by any one whose name (s) is/are not listed here, and that the order of authorship as placed in the manuscript is final and accepted by the co-authors. Declarations should be signed by all the authors in the order in which they are mentioned in the original manuscript. Matters appearing in the Journal are covered by copyright but no objection will be made to their reproduction provided permission is obtained from the Editor prior to publication and due acknowledgment of the source is made.

but no objection will be made to their reproduction provided permission is obtained from the Editor prior to publication and due acknowledgment of the source is made.

### **Abbreviations**

Standard abbreviations should be used and be spelt out when first used in the text. Abbreviations should not be used in the title or abstract.

### **Checklist**

- Manuscript Title
- Covering letter: Signed by all contributors
- Previous publication/ presentations mentioned, Source of funding mentioned
- Conflicts of interest disclosed

### **Authors**

- Middle name initials provided.
- Author for correspondence, with e-mail address provided.
- Number of contributors restricted as per the instructions.
- Identity not revealed in paper except title page (e.g. name of the institute in Methods, citing previous study as 'our study')

### **Presentation and Format**

- Double spacing
- Margins 2.5 cm from all four sides
- Title page contains all the desired information. Running title provided (not more than 50 characters)
- Abstract page contains the full title of the manuscript
- Abstract provided: Structured abstract provided for an original article.
- Key words provided (three or more)
- Introduction of 75-100 words
- Headings in title case (not ALL CAPITALS). References cited in square brackets
- References according to the journal's instructions

### **Language and grammar**

- Uniformly American English
- Abbreviations spelt out in full for the first time. Numerals from 1 to 10 spelt out
- Numerals at the beginning of the sentence spelt out

### **Tables and figures**

- No repetition of data in tables and graphs and in text.
- Actual numbers from which graphs drawn, provided.
- Figures necessary and of good quality (color)
- Table and figure numbers in Arabic letters (not Roman).
- Labels pasted on back of the photographs (no names written)
- Figure legends provided (not more than 40 words)
- Patients' privacy maintained, (if not permission taken)
- Credit note for borrowed figures/ tables provided
- Manuscript provided on a CDROM (with double spacing)

### **Submitting the Manuscript**

- Is the journal editor's contact information current?
- Is the cover letter included with the manuscript? Does the letter:
  1. Include the author's postal address, e-mail address, telephone number, and fax number for future correspondence?
  2. State that the manuscript is original, not previously published, and not under concurrent consideration elsewhere?
  3. Inform the journal editor of the existence of any similar published manuscripts written by the author?
  4. Mention any supplemental material you are submitting for the online version of your article. Contributors' Form (to be modified as applicable and one signed copy attached with the manuscript)

**Terms of Supply:**

1. Agency discount 10%. Issues will be sent directly to the end user, otherwise foreign rates will be charged.
2. All back volumes of all journals are available at current rates.
3. All Journals are available free online with print order within the subscription period.
4. All legal disputes subject to Delhi jurisdiction.
5. Cancellations are not accepted orders once processed.
6. Demand draft / cheque should be issued in favour of "Red Flower Publication Pvt. Ltd." payable at Delhi
7. Full pre-payment is required. It can be done through online (<http://rfppl.co.in/subscribe.php?mid=7>).
8. No claims will be entertained if not reported within 6 months of the publishing date.
9. Orders and payments are to be sent to our office address as given above.
10. Postage & Handling is included in the subscription rates.
11. Subscription period is accepted on calendar year basis (i.e. Jan to Dec). However orders may be placed any time throughout the year.
